CoursePMS - Lab 5 Evidence

Section 31 | Group EN-022_P6 | Evidence recorded 12 November 2026

DRAFT - NOT READY FOR SUBMISSION. The documentation PR and its teammate review are pending; update the final release links after review.

Answer Part 0 - Team and evidence index

Repository: Magiciancat9/Course_management
Sprint 1 tag: v1.0.0-sprint1 (5979f5870e8e28277996dc3045cbf4be5f7236ad)
Reviewed production merge commit: fa7f156aa782eea48c36be5f23eaa7336a582458
Recorded public URL: https://course-pms-859617270560.asia-southeast1.run.app

Member	Contribution recorded
Tatchakorn Thamnimitr (Magiciancat9)	Driver for persistence verification and documentation, Issues #27 and #24.
Pawarit Wongdaeng (martinvadre)	Release work and review; independently verified the persistence result in Issue #27.

Check	Evidence / status
C-01	Reviewed PR #36 and passing PR CI run.
C-02	PR #38 failed its required check and was blocked before being closed unmerged.
C-03	Fresh-clone verification records a no-cache build and run.
C-04	Issue #23 observation records sign-in, business action and rejection.
C-05	Issue #27 records restart and redeploy; post-deploy image appears in Part 3.
C-06	PR #36 and release workflow.

Answer Part 1 - Pull request CI and merge gate

The required job **test-and-docker** runs backend, frontend and end-to-end tests, the production build and Docker build. CI workflow on the reviewed release commit; PR #36; passing PR check (C-01).

C-02: PR #38 intentionally failed test_lab5_c02_intentional_failure in run 43242578035. While open and not a draft, GitHub reported mergeStateStatus=BLOCKED; the main ruleset required test-and-docker. The PR was closed without merging. mergeable=MERGEABLE referred to content conflicts, not permission to bypass the gate.

The earlier PR #33 was blocked by a missing check, not a failed test; it is not the failed-check proof.

Answer Part 2 - Container and configuration

Dockerfile builds the React frontend and Express server in multiple stages; the runtime image listens on port 8080. Docker Compose runs PostgreSQL separately with a named data volume. .env.example contains placeholders, not deployment secrets.

Production uses Cloud Run and Cloud SQL. DATABASE_URL and JWT_SECRET come from Secret Manager; a separate migration job applies Prisma migrations. Keyless Workload Identity Federation authenticates the release. Configuration, safe local/test commands and rollback are in deployment.md.

C-03: a fresh clone at fa7f156aa782eea48c36be5f23eaa7336a582458 was built with docker compose build --no-cache and run with a disposable PostgreSQL instance. The schema was applied to that database; at 15:13:34 UTC on 12 November, health and readiness returned HTTP 200 and readiness showed db connected. Test-only values were copied from .env.example, ports were restricted to loopback with a temporary override, and test resources and temporary configuration were removed. Recorded operator observation. No separate build-log screenshot was captured; the local health commitSha was 'local'.

Answer Part 3 - Public deployment and persistence

C-04: Issue #23 deployment observation records student and instructor sign-in, a team/proposal workflow and BR-01 / BR-06 rejections, plus health and database readiness. This is a narrative observation, not attached business-flow screenshots.

C-05: synthetic team **Lab5-Persistence-20261112** was recorded before restart on revision course-pms-00002-8hp. The service was disabled and restored; its new instance started and the team remained. After a later build with a different image digest, revision course-pms-00003-b5t also displayed the same team. The source commit remained fa7f156aa782eea48c36be5f23eaa7336a582458.

Evidence: baseline | restart | redeploy | teammate verification. Baseline and restart evidence are text; no prior screenshots are claimed.

Figure 1. Synthetic team after the new-image redeployment: 1/3 members, NO_DRAFT. No personal data shown.

Original attachment in Issue #27. The post-deploy screenshot does not itself prove the earlier restart or baseline.

Answer Part 4 - Reviewed release and running revision

The lab5-labelled task Issue #26 was implemented in PR #35 into lab5-staging, followed by independently reviewed release PR #36 into main. Its merge triggered run 43189078700: CI, image build, migration, deployment and smoke checks succeeded.

Release commit: fa7f156aa782eea48c36be5f23eaa7336a582458. A later manual run 43196661493 rebuilt the same commit, producing digest sha256:aec5f0178e7616bb5c039a6a0fca5f8e68356e412139942bd12e61550ce7fb04 and revision course-pms-00003-b5t. The post-deploy observation recorded HTTP 200 on health and readiness and the matching commit.

Release and rollback procedures, including running-commit identification, are in deployment.md. The SHA tag can move when the same commit is rebuilt; check its current digest before rollback, and verify database compatibility.

Documentation review pending: Draft PR #37 addresses Issue #24 on docs/lab5-09-evidence. Add the final release reference after review and merge; do not describe it as merged in advance.

Submission checklist

1. Complete teammate review of this document and update the documentation PR and final release links.
2. Confirm whether the instructor requires additional redacted visual evidence for C-02, C-03 or the C-04 business flow.
